

ABSTRACT OF THE DISCLOSURE

5 A television receiving apparatus and its remote
controller are provided with storage medium slots,
respectively. When a user enters program reservation
data on a remote controller, this program reservation
data is stored in an external memory via the storage
medium slot. The user attaches this external memory to
the storage medium slot of the television receiving
apparatus. The television receiving apparatus reads
10 the program reservation data from the external memory
and specifies a broadcast program corresponding to the
program reservation data from already received and
stored EPG information. The television receiving
apparatus registers reservation setting based on an
15 information element representing this broadcast program.
